

Learning the "Wright" Way To Fly!

LESSON THEME

This lesson uses the online NASA CONNECT: The "Wright" Math Educator guide and the NASA Aeronautics Activity Guide; and the Sled Kite activity to help students learn how the Wright brothers developed controllable aircraft by understanding, constructing, and testing different designs.

OBJECTIVES

Students will

- Construct three different kite models and predict the most effective design
- Design and test an aircraft given several parameters
- Explain how early flight was

NASA SUMMER OF INNOVATION

UNIT

Engineering—Aeronautics

GRADE LEVELS

7 - 9

CONNECTION TO CURRICULUM

Forces and Motion; Transfer of Energy; and Science and Technology in Society

TEACHER PREPARATION TIME

1 hour (includes 30-minute video viewing)

LESSON TIME NEEDED

Construction lesson: 1 hour (sled kite and three Wright templates)
Testing activity: 1.5 hours
Complexity: Moderate

NATIONAL STANDARDS

National Science Education Standards (NSTA)

Physical Science

- Motions and forces
- Transfer of energy

Science and Technology

- · Abilities of technological design
- Science and technology in society

History and Nature of Science

History of Science

ISTE NETS and Performance Indicators for Students

Creativity and Innovation

- Use models and simulations to explore complex systems and issues
- Develop an understanding of the core concepts of technology

Communication and Collaboration

- Contribute to project teams to produce original works or solve problems
- Develop an understanding of engineering design

Research and Information Fluency

- Evaluate and select information sources and digital tools based on the appropriateness to specific tasks
- Process data and report results

Technology Operations and Concepts

- Understand and use technology systems
- Troubleshoot systems and applications influenced by kites

MANAGEMENT

The lesson is most effective if the students build the sled kit prior to the activity. Use the template found in the NASA Aeronautics Guide "Sled Kite" activity on pages 43–51. After construction and flight of this basic kite, the actual "Wright" Math activity can be conducted. Prior to starting the construction activity, download and view the activity video. The teacher should have all three kite examples available for viewing prior to the student construction.

CONTENT RESEARCH

The Wright Brothers initially began their work on flight by studying flight in nature. Their study of birds led them to experiment with kits. They wanted to learn how to control a box kite first before they attempted to build a flying machine. They scaled up their kites to man-carrying gliders and eventually into a powered machine that incorporated these early elements of control.

KEY CONCEPTS:

- Studying objects in nature (birds) and small models (kites) can provide valuable information in understanding flight.
- The Wright Brothers use a variety of small models to understand how to control their aircraft.
- Engineering design principles are similar to the scientific method and help engineers answer and solve problems.
- Every design eventually needs to be "flight tested" to determine its performance.

KEY TERMS:

- Aerodynamic: Having a shape that allows for smooth airflow and lift
- **Aspect ratio**: Ratio of the square of the span (the widest distance from side to side) to the area of the kite
- Bernoulli's Principle: Flow of air over the long upper surface of an airfoil results in reduction of pressure creating lift
- Reflection: One-to-one mapping over a line of symmetry, a mirror image; when a point A is reflected over a line of symmetry, the corresponding point is labeled A' (A prime)

MATERIALS

Teacher Preparation Materials

- Each of 3 kite templates (for identification and clarification of directions)
- Stopwatch or some timing device (3 for entire class)
- Hole puncher (single)
- Downloadable video: The "Wright" Math

Student Materials One per 3-student group and used for both activities

- 3 Sheets of 8.5- by 11-inch multipurpose paper
- 3 metric rulers
- Masking tape
- 3 wooden skewer sticks per team (Wright Math activity)
- 3 kite string holders and kite string (often found as kit at discount stores)
- 2- by 200-cm kite tails (roll of survey tape works well)
- Scissors
- Two drinking straws per kite (sled kite activity)

LESSON ACTIVITIES

The listed sequence leads students to better understand how the Wright Brothers used the engineering design to understand how to control flight.

Engineering the Sled Kite

Students construct and fly the basic sled kite design to understand the forces of flight and how kites were used to better understand aircraft control.

- Download the sled kite activity from the NASA Aeronautics activity guide
- Ask students to build a simple sled kit and demonstrate how a kite illustrates the four forces of flight by testing http://www.nasa.gov/audience/foreducators/topnav/materials/listbytype/Sled_Kite.html

NASA CONNECT: The "Wright" Math

Students construct and predict which design will be the most effective flyer. They then test three different designs and gather time data to verify their prediction. They learn how the Wright Brothers used kites to understand aircraft control.

- Download the "Wright" Math activity guide and video:
 - o URL: http://www.knowitall.org/sites/nasa/pdf/connect/wright_math.pdf
 - Video download: http://www.knowitall.org//sites/nasa/connect/index3.html

- Show the introduction to NASA CONNECT: The "Wright" Math
- Review each of the three "Wright" Math kite templates and ask the students to predict the best performer
- Instruct the students to select and construct the one that they believe will be the best flyer
- Conduct timed flight tests outside and gather flight data

DISCUSSION QUESTIONS

If the entire The "Wright" Math is viewed, there are numerous "Cue Card" questions that can be answered. These are best reviewed by stopping the video at the appropriate point during the showing (see pages 14 and 15 of activity guide.)

Example: What is the relationship between pressure and force? There is a direct relationship between pressure and force. If the force increases, the pressure increases for a given area.

ASSESSMENT ACTIVITIES

Student progress for each activity will be assessed by collecting the student data sheets and observing the constructed "flyer" aircraft as each is tested. Students should be evaluated by observing how careful their distance measurements are determined and how well they complete their flight logs.

ENRICHMENT

If computers are available, participants can visit the Web-based activity "The Interactive Kite Modeler" and experiment with different shapes and sizes of kite design to determine the effect it has on performance. http://www.grc.nasa.gov/WWW/K-12/airplane/kiteprog.html
